6. A steam power plant operates on a theoretical reheat cycle. Steam at boiler at  $550^{\circ}\text{C}$ , 150 bar expands through the high pressure turbine. It is reheated at a constant pressure of 40 bar to  $550^{\circ}\text{C}$  and expands through the low pressure turbine to a condenser at 0.1 bar. Draw T-S and h-s diagrams. Find (i) Quality of steam at turbine exhaust (ii) Cycle Efficiency (iii) Steam rate in Kg/ Kw-hr.

## OR

7. Describe the different operations of Rankine cycle and also derive the expression for its efficiency.

UNIT - IV  
 L4 10M

8. Steam initially dry and saturated is expanded in a nozzle from 15 bar at  $300^{\circ}\text{C}$  to 1.0 bar. If the frictional loss in the nozzle is 12% of the total heat drop calculate the mass of steam discharged when exit diameter of the nozzle is 15 mm.

9. Explain about Surface condenser and discuss its types with neat sketches.

10. A stage of a steam turbine is supplied with steam at a pressure of 50 bar and  $350^{\circ}\text{C}$ , and exhausts at a pressure of 5 bar. The isentropic efficiency of the stage is 0.82 and the steam consumption is 2270 kg/min. Determine the power output of the stage.

- The following data refer to a particular stage of a Parsons' reaction turbine Speed of the turbine = 1500 r.p.m. Mean diameter of the rotor = 1 metre, Stage efficiency = 80 per cent. Blade outlet angle =  $20^{\circ}$ , Speed ratio = 0.7 Determine the available isentropic enthalpy drop in the stage.
